Custom brush tools are implemented in a similar way as OS X's built-in filters. I owned an internet business, so I was trying to get a website done. There weren't many options online for a beginner like me. I decided to give Adobe Stock a try (I highly recommend this to anyone that wants to learn about photography). I got a little frustrated because it didn't want to work. I just did everything the same way in Photoshop CC and it would never work until I redesigned everything from scratch. I had to waste hours trying to make this site work. (.) I kept going back and forth between the two. Photoshop CC was working, but I wasn't having much luck with making websites work (no offense to those that make websites). So, I started searching for a better version. I tried the subscription of Photoshop CC, and when I started using Lightroom, I found a way to make this site work. Adobe replaced its legacy plug-in distribution model with a new module-based technology for both Premiere Pro and Photoshop. The change to module-based distribution makes it easier for developers to work on individual modules and easier for users to find what they need in the application's features. This innovative new module-based technology also makes it easier to develop new features because it makes it an order of magnitude less difficult to have a developer build a completely new feature in a module. The modular architecture also separates out components into discrete tools, making it easier to move features into separate modules and extend features or patch them in a more efficient way. Users can now tell Photoshop to "share for review" any changes made to a file with another person, who will be able to quickly view changes on the file without installing the full Photoshop Creative Cloud offering. This means two people now can work together on an image simultaneously, without the need to send a file over lunch. Users can also share a project for review using this feature, as well, as Adobe has created a new CLI command and a UI control for doing this. When artists share images for review, they can mark the file as being created in the last 24 hours, three days, or even three months for the designers (or later, for developers to review the code). A preview tool is always available for each version of the file, as well as the original version to enable the reviewer to compare the changes made in real-time. When the reviewer clicks the Require Change button, Photoshop automatically streamlines the review process, instantly bringing all the shared changes into a single diff view. This frees up the reviewer to make changes incrementally, view the entire diff in the UI, or directly modify the image without the review process.
